ALTERNATIVE FORECASTS

LAND USE

Each alternative growth forecast has different implications for land use within the SCAG region. The different population and housing growth rates reflected in the alternative forecasts will convert different amounts of non-urban land to urban uses. This volume of the PHEL Report presents land use forecasts which reflect the different growth and distribution assumptions made in the alternative population and housing forecasts.

The chart on the next page shows county and regional totals for each alternative. As can be seen the total developed urban acres varies significantly between alternatives. For example, the Low Growth (E-0) alternative's 2000 Total Developed Urban Acres is 8% below the 2000 total for SCAG-76 Modified, and 16% below the Dispersed alternative.

The variations between alternatives can be further emphasized by looking at the varying amounts of growth that occurs within an RSA. In the Palm Springs area (RSA 52), SCAG-76 Modified forecasts Urban Acres to grow 8,100 acres (70%) by the year 2000. On the other hand the Concentrated alternative, which emphasizes growth in existing urban areas, forecasts only 5,500 acres (48%) growth by 2000, and the Coastal/Desert alternative forecasts 14,700 acres (128%) growth.

The land use forecasts by RSA are presented in two sets of tables. In the Developed and Potentially Developable Acreage tables, each alternative's Developed Urban Acres and Vacant or Agricultural Acres Under 25% Slope are presented for the years 1975, 1990 and 2000. The Undevelopable Acreage tables present, by RSA, those land use categories which are expected to remain unchanged as urban development occurs: Vacant with Slope 25% or Greater and Committed Open Space and Water. This second table of Undevelopable Acreage can be combined with any of the alternatives in the Developable Acreage tables to get total acres by RSA.

Estimates of 1975 acreages are used as a base year from which the alternative land use forecasts were made. The base year estimates incorporate the most recent land use inventories prepared by each county within the SCAG region. When a land use inventory was for a year other than 1975, a straight-line interpolation was made between the inventory year and the SCAG-76 Modified 1980 forecast to get a 1975 base year. In Orange County New RSA's were used for the base year and the forecasts.

DEVELOPED AND POTENTIALLY DEVELOPABLE ACREAGE

METHODOLOGY

The SCAG-76 Modified land use forecasts represent modifications of the SCAG-76 forecasts to include newer land use inventories. The original SCAG-76 forecasts were made with the aid of the Development Guide Land Use Model. The land use forecasts were also adjusted to reflect increased urban uses resulting from the SCAG-76 Modified housing forecast which shows a greater growth in housing than originally anticipated.

The remaining five land use forecasts are variations of the SCAG-76 Modified forecast. The ratio of added urban acres to added dwelling units shown in the SCAG-76 Modified forecast for each RSA was used to calculate the land use figures for the Sum of Local Government Forecast/E-150, Coastal/Desert, and Low Growth (E-0) forecasts. Each of these alternatives assures that new development will be at the same density as SCAG-76 Modified. In some RSA's (such as RSA's 23, 35 and 37) the growth in Developed Urban Acres was limited to the amount of Vacant or Agricultural Acres Under 25% Slope available in that RSA.

For the Concentrated alternative the ratio of added urban acres to added dwelling units was reduced by 10%. This reduction reflects an assumption that concentrated development would be denser than shown in SCAG-76 Modified and therefore there would be more dwelling units per new urban acre. In the Dispersed alternative the urban acres to dwelling units ratio was increased by 10% to present lower densities than shown in SCAG-76 Modified.

DEVELOPED AND POTENTIALLY DEVELOPABLE ACREAGE

FOOTNOTES

*Based on the land use estimates shown in the original SCAG-76 Growth Forecast Policy. These land use estimates were made in the early 1970's using county input.

SCAG-76's Urban Acres (residential, commercial, industrial, and other urban uses) was used for Developed Urban Acres.

SCAG-76's Available Acres (non-developed urban land, agricultural lands not in preserves, and vacant lands with slope less than 25%) was used for Vacant or Agricultural Acres Under 25% Slope.

[†]Land use category sub totals differ from SCAG-76 Modified due to corrections of mathematical errors in the SCAG-76 Modified publication.

UNDEVELOPABLE ACREAGE

FOOTNOTES

^aBased on the land use estimates shown in the original SCAG-76 Growth Forecast Policy. Those land use estimates were made in the early 1970's using county input.

SCAG-76's Preserved Acres (committed open space, agricultural preserves, slope over 25%, etc.) was used for Committed Open Space and Water. Separate information regarding Vacant with Slope 25% or Greater was not available.

^bLos Angeles County's Low and Very Low Suitability for Development categories were used. These categories include slope greater than 30%, potential and active fault areas, landslide areas, flood prone areas, significant ecological areas and their buffer zones, and sand and gravel extraction sites.

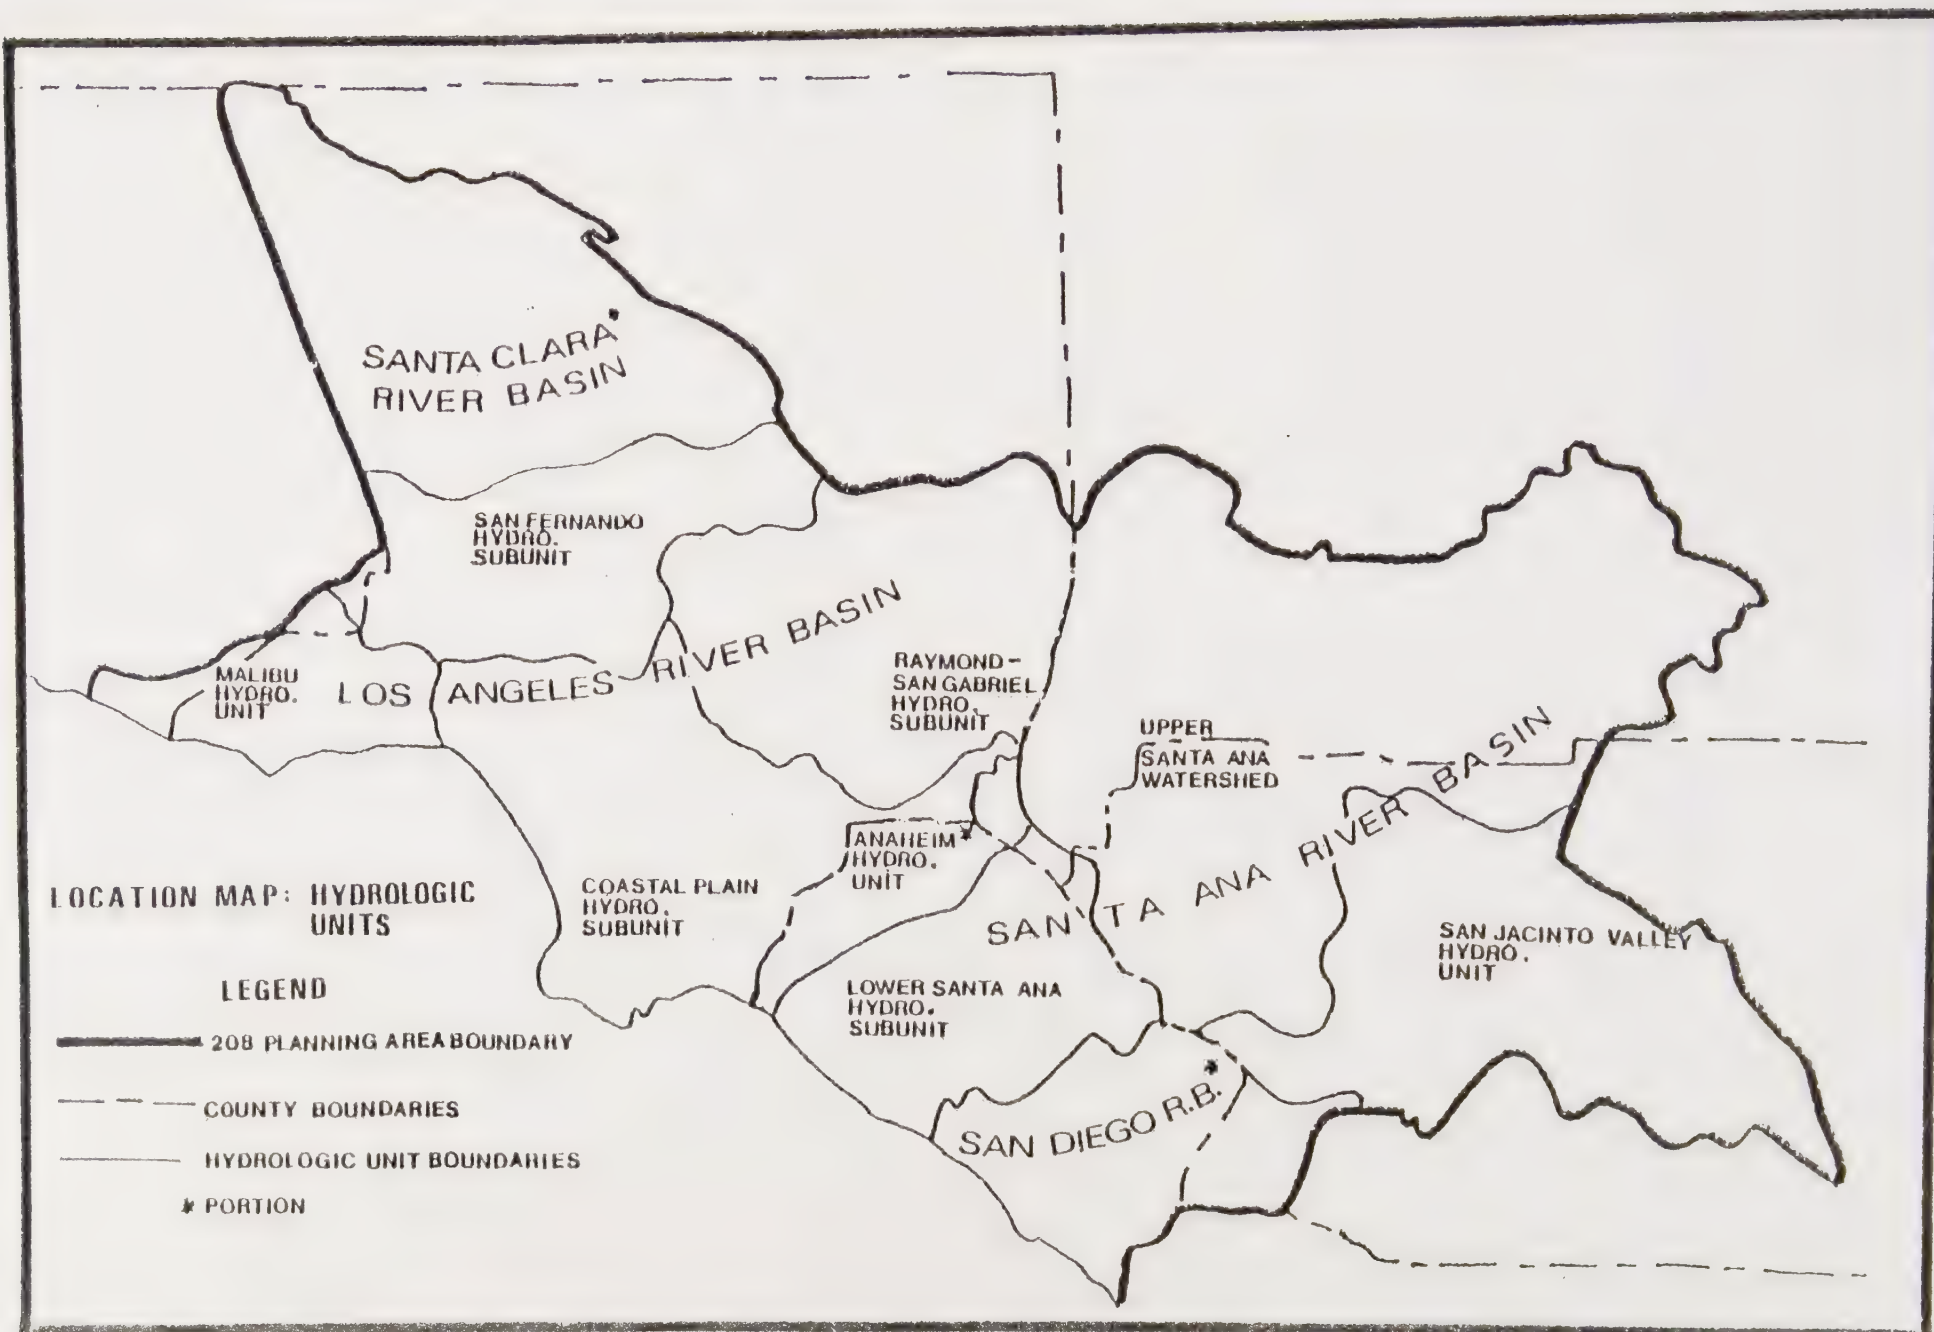

^cBased on San Bernardino County "208" Task I report - "Vacant, Undevelopable".

^dOrange County Land Use is by new RSA's.

^eSub Total: representing total for areas where data were available but does not represent total Vacant with Slope 25% or Greater.
